

In class work 23 has questions 1 through 1 with a total of 4 points. Turn in your work at the end of class *on paper*. This assignment is due at *Tuesday 21 November 13:20*.

"Piglet noticed that even though he had a very small heart, it could hold a rather large amount of gratitude."
A. A. MILNE

1. Consider the parametrically defined curve $\mathcal{C} = \begin{cases} x = \frac{t}{1+t^2}, \\ y = \frac{2t^2}{1+t^2} \end{cases}, -\infty < t < \infty.$

- 1 (a) Use Desmos to draw this curve. Reproduce the curve as best you can on here:

- 1 (b) Is the point $(x = 0, y = 2)$ on the curve? The picture might indicate that it is, but is it really? To decide, you'll need to solve the equations

$$0 = \frac{t}{1+t^2}, \quad 2 = \frac{2t^2}{1+t^2}.$$

Solution: No, the point $(x = 0, y = 2)$ is not on the curve \mathcal{C} . To prove this, we need to solve the equations

$$\left[0 = \frac{t}{1+t^2}, 2 = \frac{2t^2}{1+t^2} \right] = [0 = t, 2 + 2t^2 = 2t^2].$$

The solution set is empty, so $(x = 0, y = 2)$ is not on the curve \mathcal{C} .

Arguably, $t = \infty$ is a solution of the equations $\left[0 = \frac{t}{1+t^2}, 2 = \frac{2t^2}{1+t^2} \right]$. Indeed

$$\lim_{t \rightarrow \infty} \frac{t}{1+t^2} = 0 \text{ and } \lim_{t \rightarrow \infty} \frac{2t^2}{1+t^2} = 2.$$

1

- (c) Solve $\frac{dy}{dt} = 0$ and $\frac{dx}{dt} \neq 0$. Each solution will give a point on the curve with a horizontal tangent line.

Solution:

$$\left[0 = \frac{dy}{dt} \right] = \left[0 = \frac{4t}{1+t^2} \right] = [t = 0] \quad (1)$$

A calculation shows that when $t = 0$, we have $\frac{dx}{dt}\big|_{t=0} = 1$. So the only HT happens when $t = 0$. And that makes $x = 0$ and $y = 0$.

The picture might make us think that there is a HT when $x = 0$ and $y = 2$. But $(x = 0, y = 2)$ is not a point on the curve \mathcal{C} , so the curve doesn't have an HT at $(x = 0, y = 2)$.

1

- (d) Substitute $\begin{cases} x = \frac{t}{1+t^2} \\ y = \frac{2t^2}{1+t^2} \end{cases}$ into $4x^2 + y^2 - 2y = 0$. Explain why that shows that the curve \mathcal{C} is a *portion* of an ellipse, but not the entire ellipse.

Solution: Let $x = \frac{t}{1+t^2}$ and let $y = \frac{2t^2}{1+t^2}$ into $4x^2 + y^2 - 2y = 0$ gives

$$4\left(\frac{t}{1+t^2}\right)^2 + \left(\frac{2t^2}{1+t^2}\right) - 2\frac{2t^2}{1+t^2} = 0. \quad (2)$$

We've shown that if $x = \frac{t}{1+t^2}$ and $y = \frac{2t^2}{1+t^2}$, then $4x^2 + y^2 - 2y = 0$

We did not show that if $4x^2 + y^2 - 2y = 0$, there is a number t such that $\begin{cases} x = \frac{t}{1+t^2} \\ y = \frac{2t^2}{1+t^2} \end{cases}$. And it's a good thing we didn't prove it because it is false.

We have $(x = 0, y = 2)$ is a point on the graph of $4x^2 + y^2 - 2y = 0$, but $(x = 0, y = 2) \notin \mathcal{C}$.
